SUPPLEMENT TO

25X1X REPORT NO

- 1. The Dzerzhinsk Tractor Plant was in the northwestern outskirts of Stalingrad. The plant was almost completely reconstructed. Until 1940 power was supplied partly from a small plant-owned power station and partly from a power plant in Stalingrad. In 1940 the plant-owned power station was closed and the construction of the Toplo Elektro Tsentral (Next and Power Plant) (TETS) was started. The boiler installation was almost completed by mid-1949. Late in 1949 the construction work on the power plant building had progressed to such an extent that the installation of machinery could be started. One source who worked on the construction of the TETS Plant Learned from Soviets that one boiler installation was scheduled to be in operation by 1950 and the second one by 1952, at which time the plant would no longer be dependent upon power supplied from the outside. *
- 2. This plant produced the NATE 35 tractor. The daily production was 27 to 30 tractors in 1946 and 50 to 60 tractors in 1949. The production of the DT-54 model was started in mid-1949. The first substantial shipment of DT-54 models left the plant in Kovember 1949. According to information from Soviets, 30 to 35 DT-54 tractors were scheduled to be produced in Movember 1949. We In addition to the production of complete tractors, tractor spare parts were also produced. The production of spare parts was very irregular. The daily volume sometimes consisted of only a few boxes and sometimes of several carloads. The spare parts were shipped to the Lotor Tractor Stations (LTS) in Kharkov (50000 M/36°15°1), Rostov (47°15'11/39°53'11) and Aiev (50°27'11/30°32'11) and to destinations in the Soviet Lone of Germany. Occasional shipments also left for the tractor plants in Kiev and Leningrad. With regard to the recipients of the tractors, it was only known that some shipments left for the Soviet Zone of Germany. The destinations of tank engine shipments were not known. Soviets said that the tank engines were shipped to a tank plant near Stalingrad. Soviets also said that the Hed October Flant in Stalingrad supplied some of the raw materials for the Dzerzhinsk. Tractor Flant.
- 3. Production of tank engines practically ceased in February 1948. However, some sources observed occasional shipments of tank engines leaving Workshops No 400 and 900 as late as mid-1949. It was rumored that Workshop No 100 was producing component parts for tank engines. Tank officers were constantly seen in the plant. They mainly visited Workshops No 25, 100, 400 and 900.

å a	Sources learned during meetings of plant workers that the waste percentage was very high. The waste amounted to 10 to 15 percent in the gray from foundry and about 20 percent in Merkshop No 25. Occasionally as many as 30 percent of the tractors were found to be in dubious working condition during the final acceptance tests.	
S a	The number of employees in the plant was estimated to have been 12,000 to 15,000 during mid-19h9. Work was done in three shifts in almost all departments. Several sources reported that, according to Soviets, the plant cmployed 3,1000 workers. The plant was surrounded partly by a wall and partly by a wire fence and was guarded by armed civilian militia.

સુના	Comment. The indicated tractor production figures appear to be credible although it is believed the daily rate of 27 to 30 units may not have been achieved until late in 1946. The designation of the tractor types is not quite correct. The first postwar tractor produced was the SSCHIS tractor with a 32 hp kerosene engine. It is believed source meant this tractor when he referred to the "MATI 35" tractor model. Next came the SSCHIS-MATI tractor with a 52 hp herosene engine, which in turn was followed late in 1949 by the DI-5h model with a 54 hp Diesel engine.
